Engineering is about designing and making marketable artefacts. The element of design is what principally distinguishes engineering from science. The pure scientist is concerned with knowledge for its own sake and receives his greatest satisfaction if his experimental observations fit into an aesthetically satisfying theory. The applied scientist or engineer is also concerned with theory, but in a business sense, where the theory will encompass the known experimental facts, both because an all-embracing theory has intrinsic aesthetic value and also because it can help to guide fruitful experimental investigation. This present book. The first internal combustion engines, produced just over one hundred years ago, were very simple, the design being based on very limited experimental information. The current engines are extremely complex and, while the basic design of cylinder, piston, connecting rod and crankshaft has changed but little, the overall performance in respect of specific power, fuel economy, pollution, noise and cost has been absolutely transformed.
